## Scientific Analogies

Animals in the future will have elevated positions from now. They will be highly trained and used in schools as teacher aides and playground guides. They will also be used as message and errand runners in certain occupations. Owners and pets will be matched by their musical tones and colors and pets will have exercise programs and medical checkups and R & R homes, even as their owners will have. Their food will be as carefully controlled as that of their owners only necessarily of a different variety.

### Animals Compared to Teachers

There is a fine line between feelings of separateness and feelings of self-esteem. This fine line can be explained by using examples from the Animal Kingdom and perhaps these examples will also help adults.

### Cats

The cat is a very good example of separateness. He wants nothing to do with most other cats. Now this cat has self-esteem, but he has gone way past the point of balance. He declares a certain area his territory and wants no one else to enter it. This cat cannot be taught that he should not set himself apart from others. He, more than humans, is a part of all animals, as they all have the same oversoul.

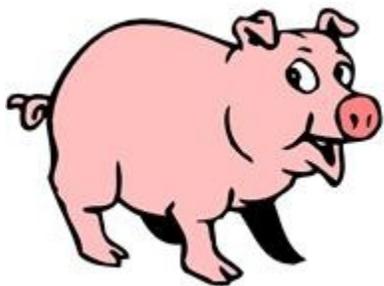

## Dogs

Dogs, on the other hand, can have feelings of separateness like cats, or can be the opposite, very friendly and loving and wanting to be with other dogs and even cats, who usually want no part of them. Dogs come closer to expressing true brotherhood of man than man himself. They surely could be our teacher in this respect.

## Chicken

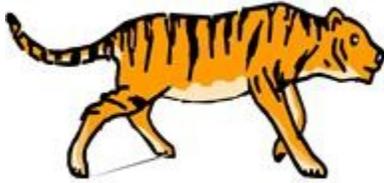

A chicken can teach the motion needed to walk on the moon.

## Pig

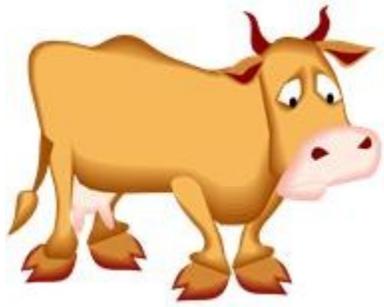

A pig can teach the necessity of having digestive juices.

## Large Cat

A large cat (lion, tiger, cougar, puma, panther, etc.) can teach accurate exercise routines for the human vertebrae and spiny, bony structure of the form.

## Cow

A cow can teach the necessity of chewing for contentment. There is a definite correlation for those with teeth to need to have the act of chewing to stimulate digestive action.
